

# 2.3 SLOPE

$$m = \frac{+\uparrow - \downarrow}{+\rightarrow - \leftarrow}$$

$$m = \frac{3}{4} \quad b = 0$$

$$= -\frac{3}{4}$$

What is **SLOPE**?

Steep a line is

$$m = \frac{\text{rise}}{\text{run}} = \frac{\text{change in } y}{\text{change in } x} = \frac{y_2 - y_1}{x_2 - x_1}$$

**Rate of Change**

1. Find the slope of a line that passes through (1,3) & (-2,-3). Then graph.

$$m = \frac{-3 - 3}{-2 - 1} = \frac{-6}{-3} = 2 \text{ or } \frac{2}{1}$$

2. Graph the line that passes through (1,-3) with slope -3/4.

$$m = -\frac{3}{4} \text{ or } \frac{3}{-4}$$

+ slope

- slope

slope = 0

slope is undefined

(x can be anything)

x = 5 (y is can be anything)

Parallel lines - Slopes are equal  
 - they never intersect

Perpendicular Lines - opposite reciprocal slopes  
 $\frac{2}{3} \rightarrow -\frac{3}{2}$

3. Graph the line through (1, -2) parallel to  $x - y = -2$ .

$$m = \frac{1}{1}$$

$$\begin{aligned} x - y &= -2 \\ -y &= -x - 2 \\ y &= x + 2 \end{aligned}$$

$m = 1$

4. Graph the line through (2, 1) perpendicular to  $2x - 3y = 3$

$$\begin{aligned} 2x - 3y &= 3 \\ -2x &\quad -2x \\ \hline -3y &= -2x + 3 \\ \frac{-3y}{-3} &= \frac{-2x + 3}{-3} \\ y &= \frac{2}{3}x - 1 \end{aligned}$$

$m = \frac{2}{3}$

$$y = \frac{3}{2}x - 1$$

$\rightarrow \frac{3}{2} \downarrow$   
 $\frac{2}{3} \rightarrow$
