

Algebra Ch. 9

Algebra 9-1: Quadratic Equations $y = ax^2$

Graph without a calculator.

1. Make a table. Put x in one column and y in the other. Pick x-values and find their corresponding y values. Remember to use PEMDAS or order of operations when finding values.
2. Plot the points.
3. You can always use symmetry to help plot points.

1. $y = x^2$ Parent

x	y
-2	4
-1	1
0	0
1	1
2	4

$y = x^2$

$y = (-2)^2 = 4$
 $y = (-1)^2 = 1$
 $y = (0)^2 = 0$
 $y = (1)^2 = 1$
 $y = (2)^2 = 4$

2. $y = 2x^2$

The "2" made it narrower

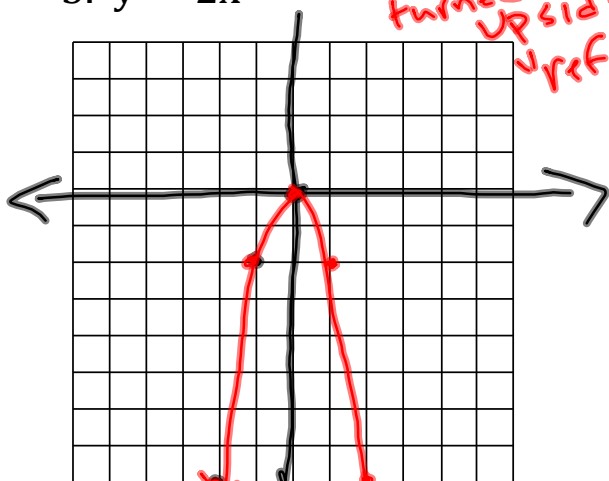

x	y
-2	8
-1	2
0	0
1	2
2	8

$y = 2x^2$

$y = 2(-2)^2 = 8$
 $y = 2(-1)^2 = 2$
 $y = 2(0)^2 = 0$
 $y = 2(1)^2 = 2$
 $y = 2(2)^2 = 8$

3. $y = -2x^2$

the "-" turned it upside down
"reflection"

x	y
-2	-8
-1	-2
0	0
1	-2
2	-8

$y = -2x^2$

$y = -2(-2)^2 = -8$
 $y = -2(-1)^2 = -2$
 $y = -2(0)^2 = 0$
 $y = -2(1)^2 = -2$
 $y = -2(2)^2 = -8$

4. $y = (1/2)x^2$ wider

x	y
-2	2
-1	.5
0	0
1	.5
2	2

$y = \frac{1}{2}x^2$

$y = \frac{1}{2}(-2)^2 = 2$
 $y = \frac{1}{2}(-1)^2 = .5$
 $y = \frac{1}{2}(0)^2 = 0$
 $y = \frac{1}{2}(1)^2 = .5$
 $y = \frac{1}{2}(2)^2 = 2$

A parabola is created when X is to the second power.

On the graph to the right, label/draw the following:

Parabola

Axis of Symmetry

Vertex

Maximum

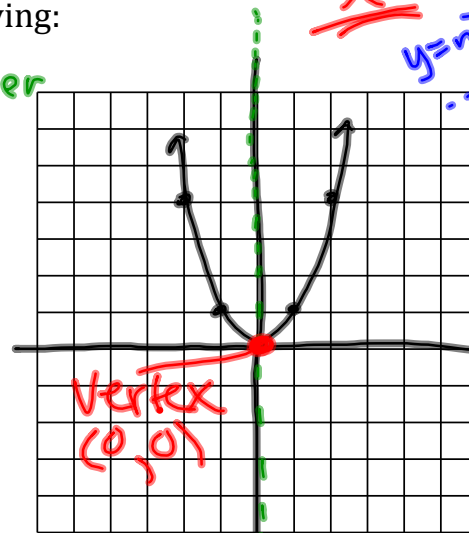

Minimum

Opening up

Opening down

(x, y)

$x = \square$ a number

x^2
 Note
 $y = mx + b$ line
 $y = bx^2$ parabola
 exponents!

$x = 0$ (axis of sym)

*When an object is dropped use $d = 16t^2$, where d = distance in feet and t = time in seconds.

Assignment 9-1

3-6, 9-21, skip 16, 3 graphs
