

6-3 day 2

I. Find the component form of v given its magnitude and the angle it makes with the positive x-axis. Sketch v .

Ex 1) $\|v\| = 4$

$\theta = 30^\circ$

$\frac{4}{2} = 2$
 $\langle 2\sqrt{3}, 2 \rangle$

Ex 2) $\|v\| = 3\sqrt{5}$

$\theta = 120^\circ$

$\frac{3\sqrt{5}}{2} = \sqrt{3}$
 $\langle -\frac{3\sqrt{5}}{2}, \frac{3\sqrt{5}}{2} \rangle$

Ex 3) $\|v\| = 2$

$\theta = 180^\circ$

$\langle -2, 0 \rangle$

II. Graph the vectors and the resultant of the vectors. Find the magnitude and direction of the resultant.

sum

Note: Trig Form of a Vector: $\mathbf{v} = \langle ||\mathbf{v}||\cos\theta, ||\mathbf{v}||\sin\theta \rangle$ θ must be an angle in standard position

Ex 4)

$$\begin{aligned} &\langle 600 \cos 20^\circ, 600 \sin 20^\circ \rangle \\ + &\langle 500 \cos 60^\circ, 500 \sin 60^\circ \rangle \\ \hline &\langle 813.82, 638.72 \rangle \end{aligned}$$

$$\begin{aligned} ||\mathbf{v}|| &= \sqrt{(813.82)^2 + (638.72)^2} \\ &= 1034.23 \end{aligned}$$

$$\begin{aligned} \tan \theta &= \frac{638.72}{813.82} \\ \theta &\approx 38.10^\circ \end{aligned}$$

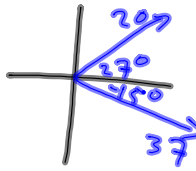

III. **Applications:** Force = Speed = Magnitude

Ex 5) Find the component form of the vector that represents the velocity of an airplane descending at a speed of 100 mph at angle of 30 degrees below the horizontal (as shown).

$$\begin{aligned} &\langle 100 \cos 210^\circ, 100 \sin 210^\circ \rangle \\ &\langle 100 \left(-\frac{\sqrt{3}}{2}\right), 100 \left(-\frac{1}{2}\right) \rangle \\ &\langle -50\sqrt{3}, -50 \rangle \end{aligned}$$

Ex 6) My two kids wanted to take our 100 lb black lab Baily for a walk. They devise a scheme to use 2 leashes on Baily so both could attempt to walk her. Baily rebels and starts pulling on the kids. Dani is pulling with a force of 20 lbs at an angle of 27 degrees while Drew is pulling with a force of 37 lbs at an angle of -15 degrees. How hard is Baily pulling if she holds Dani and Drew at a standstill?

$$\text{Dani} \langle 20 \cos 27^\circ, 20 \sin 27^\circ \rangle$$

$$\text{Drew} \langle 37 \cos -15^\circ, 37 \sin -15^\circ \rangle$$

$$+$$

$$\vec{v} = \langle 53.56, -0.4967 \rangle$$

$$\|\vec{v}\| = \sqrt{(53.56)^2 + (-0.4967)^2}$$

$$= 53.56 \text{ lbs}$$

$$\tan \theta = \frac{-0.4967}{53.56}$$

$$\theta = -0.53^\circ$$
